

## **Alternate Smart Boost Wiring and Operation Method**

In some circumstances, the Smart Boost's electronics work more efficiently when following the instructions below, instead of the method outlined in the instructions:

1. Wire the Smart Boost's voltage leads to the ESC's battery tabs (as shown in the instructions).
2. Plug the Smart Boost's output harness into a free slot in the receiver (as shown in the instructions).
3. Remove the red wire from the ESC's signal harness and insulate it so that it cannot short out against anything.

Once the red wire is removed from the ESC's signal harness, it is, consequently, isolated from the power feed coming from the Smart Boost.

### **VEHICLE OPERATION**

To operate your car, first turn on the Smart Boost switch, then turn on the ESC's switch.

To turn off your vehicle, turn off the ESC's switch, then the Smart Boost's switch.

***NOTE:*** *When the vehicle is not in operation, it is always recommended to disconnect the battery from the vehicle's electronics.*
